Character Input Solutions

Because I cannot include every single submission I get, I will choose one or two that are example answers and include those within each post.

Exercise 1

Create a program that asks the user to enter their name and their age. Print out a message addressed to them that tells them the year that they will turn 100 years old.

Sample solution

```
1 name = input("What is your name: ")
2 age = int(input("How old are you: "))
3 year = str((2014 - age)+100)
4 print(name + " will be 100 years old in the year " + year)
```
